

Manage Multiple WordPress Sites

Centralise updates, backups, security audits and one-click logins across all your WordPress sites. One dashboard, unlimited sites, £19.99/month.

Phil E. Taylor | 12 March 2026

If you're looking after more than a handful of WordPress sites, you already know the pain. Logging into each one individually to check for updates, run backups, or see if something's broken. It doesn't scale, and it gets old fast.

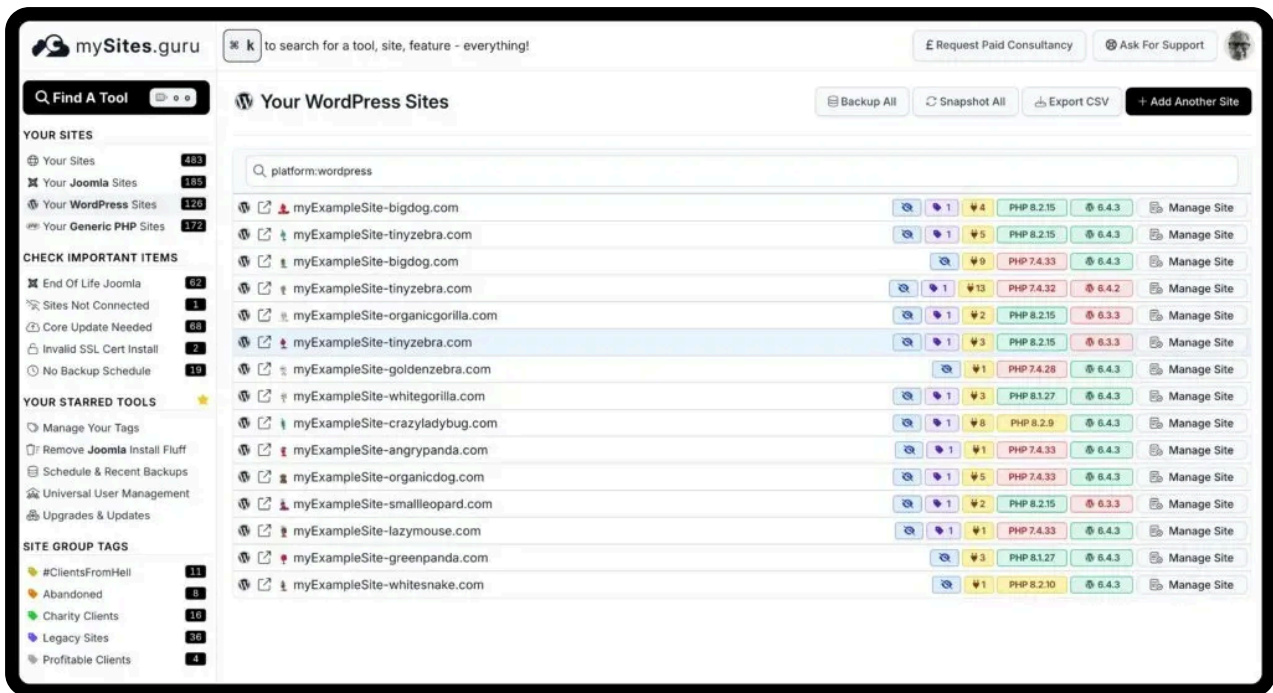

I built [mySites.guru](https://mysites.guru) to fix exactly this problem. One dashboard, all your sites, no per-site fees.

What is the problem with multiple WordPress sites?

A single WordPress site is fine. You log in, update your plugins, check your security, move on. But once you're managing 10, 50, or 200 sites for clients, that approach falls apart. You end up with browser tabs everywhere, forgotten updates, and security issues you don't find out about until a client emails you in a panic.

Most people try to solve this with spreadsheets, bookmarks, or sheer willpower. None of those work long-term.

What does mySites.guru do differently?

The [mySites.guru dashboard](#) shows site health, update counts, security alerts and uptime status across every connected site. No more logging into each one.

The [audit tools](#) scan every file in your web space for [hacks and backdoors](#), not just the obvious stuff. You get [real-time alerts](#) when files change or someone logs into an admin panel. This matters because [site management goes deeper than updates, backups, and uptime](#).

[Update WordPress core, plugins, and themes](#) across hundreds of sites at once. You pick what to update, hit go, and get notified when it's done. You can also [disable automatic updates](#) so nothing changes without your approval. The full process for [managing multiple WordPress sites](#) - including how to structure your setup from day one - is covered in the dedicated landing page.

Set up [automated backup schedules](#) using Akeeba Backup or All-In-One Migration. You can [run backups across thousands of sites](#) from the dashboard without touching FTP or SSH.

[One-click admin login](#) lets you jump straight into any site's admin panel without remembering passwords. It's genuinely the feature people tell me they use most.

If you're an agency, white-label client reports let you send branded reports to clients showing what you did, when, and why. Useful for proving your value at invoice time. You can also remove the WordPress logo from the admin bar with one click for a cleaner, branded admin panel.

What best practice checks run on every site?

The mySites.guru snapshot and audit tools run over 100 checks on each site, twice a day. Security headers, PHP versions, SSL certificates, disk space, and more. You don't have to remember to check. It just tells you when something needs attention.

Claim your free audit and see for yourself.

The screenshot displays the mySites.guru dashboard for a client named Tommi Sydow. The interface includes a search bar at the top, navigation options like 'Visit Site' and 'Admin Login', and a sidebar with 'YOUR SITES' and 'CHECK IMPORTANT ITEMS'. The main content area shows a 'WordPress Configuration' audit with various items, each with a status (OK or Issue) and a 'Learn' or 'Investigate' button. The audit items include:

- WordPress Version Must Be Up-to-date (Issue)
- Use A Valid SSL Certificate To Secure Traffic (OK)
- WordPress Address Should Normally Equal Site Address (OK)
- Password Protect WP-Admin (Issue)
- Disable XML-RPC In WordPress (Issue)
- Don't Discourage Search Engines From Indexing This Site (OK)
- Don't Use The Default Distributed Salt Values (OK)
- Remove Default Tag Line "Just Another WordPress Site" (OK)
- Remove The Default "Sample Page" (OK)
- Remove The Default "Hello World!" Post (OK)
- Don't Leave WP_DEBUG: Development Mode On (OK)
- Don't Leave WP_DEBUG_LOG: Development Mode On (Issue)
- Don't Leave WP_DEBUG_DISPLAY: Development Mode On (OK)
- Disable File Editing Through Admin Console With DISALLOW_FILE_EDIT (Issue)
- Enable FORCE_SSL_ADMIN To Secure Admin Connections (OK)
- Enable FORCE_SSL_LOGIN To Secure Login Connections (@Deprecated) (Issue)
- Prohibit Database Repair With WP_ALLOW_REPAIR Constant (OK)

Does it work with more than just WordPress?

mySites.guru also works with Joomla and any PHP-based site. Craft, OctoberCMS, whatever you're running. If it has PHP, you can connect it. Unlimited sites, one flat monthly price.

Multi-site management is covered comprehensively in our [agency guide](#).

Frequently Asked Questions

What does mySites.guru do to help manage multiple WordPress sites?

It provides a single dashboard covering updates, security audits, scheduled backups, one-click admin logins, and uptime monitoring across all connected sites.

Does mySites.guru work with sites other than WordPress?

Yes - it also supports Joomla and any PHP-based CMS, including Craft, OctoberCMS, and others, all under one flat monthly price with no per-site fees.

How often does mySites.guru run security and best practice checks?

The snapshot and audit tools run over 100 checks on each connected site twice a day and alert you when something needs attention.
