

# Tools for Managing Multiple Sites

The mySites.guru Snapshot All button refreshes version data, security checks and best practice results across every connected site in one click.

Phil E. Taylor | 16 March 2026

*Ok another Friday release - we deploy 7 days a week, and especially on a Friday, our favourite day for features to be released and deployed!*

Earlier in the week we reinstated the "Backup All" sites button, this time its the "Snapshot All" button!

One of the most requested features this week was the ability to **update the snapshot of all sites in one go**. This is useful just before a mass update of Joomla or WordPress sites.

The mySites.guru snapshot is the quickest collection of data we run. Whereas the audit requires us to look at every single file in your webspace, and then audit every single line of every single file, the snapshot is looking for very specific things.

Some of the data is version numbers, PHP Version, Joomla Version, WordPress Versions, PHP Configuration settings etc.

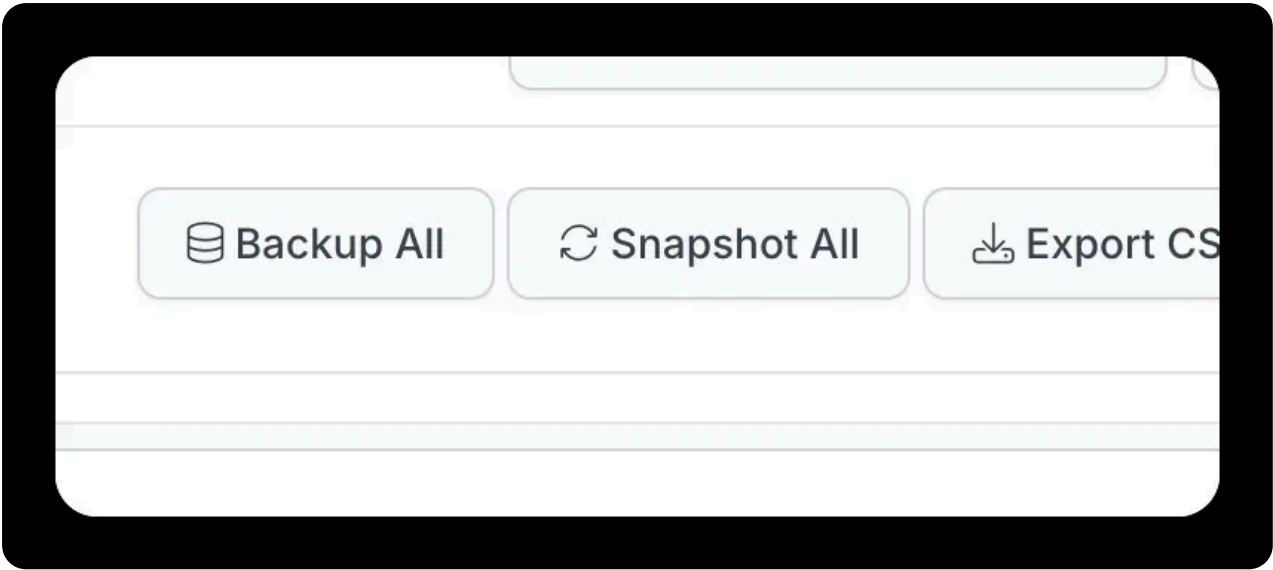

Some of the data is specific checks, looking at specific configuration options in your site to ensure you are following all the best practice we are promoting.

We also look for specific hacks that are quick to find.

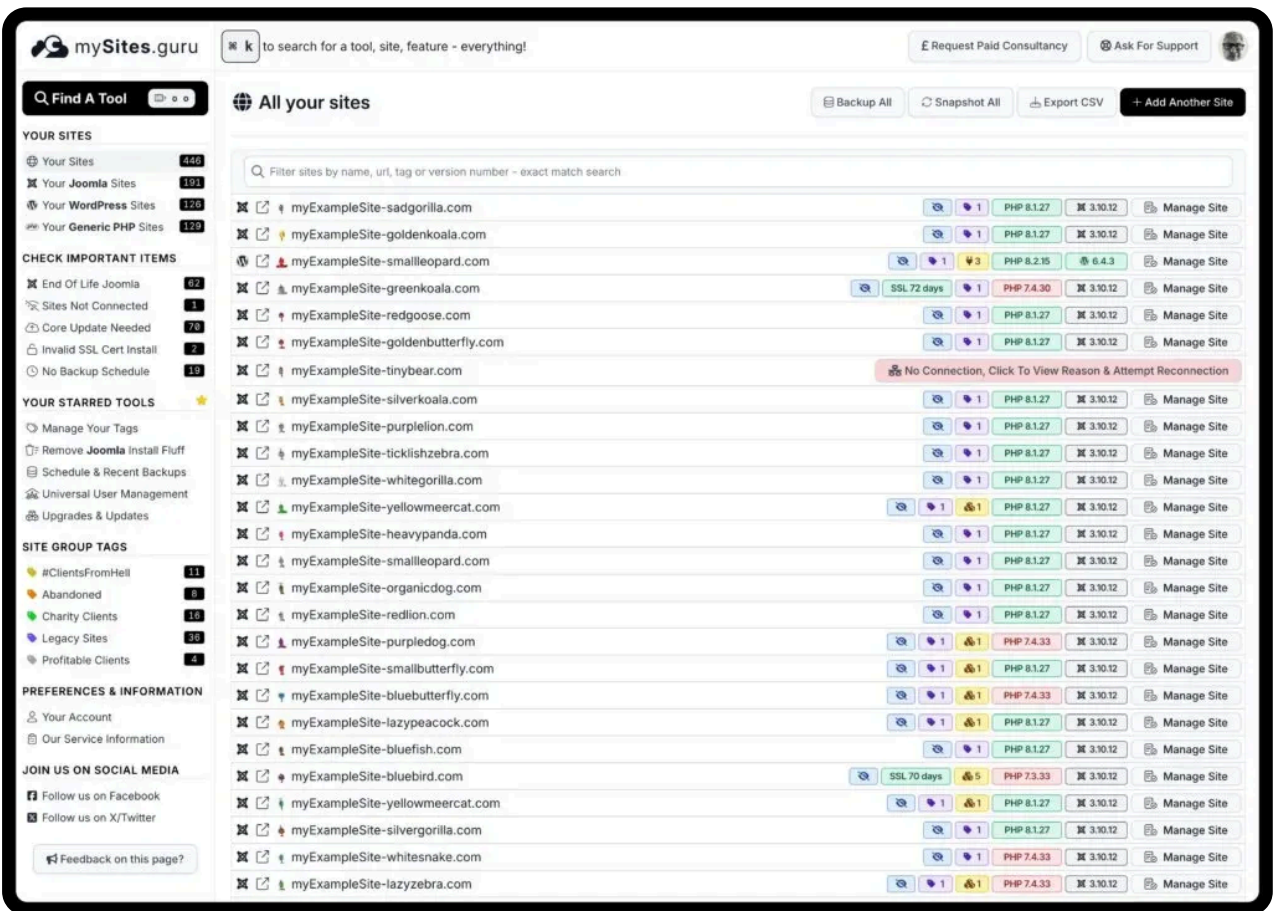

## **Where is the "Snapshot All" button?**

*"Actually mySites.guru had this button way back in 2012 when we first launched when we only had a few sites and we did not need to worry about scaling our service*

*It was removed when we started getting busy :)"*

You can find the new button at the top right of the main sites overview page, this page shows some of the version numbers and results of the snapshot.

Once you press this button, we will use a job into our queue for each site, with a short load balancing delay to not overload your web servers, and snapshot each site.

This will also update the [list of updates available for each site](#).

You can then carry on using mySites.guru as we will do this in the background for you, and update the data as soon as we receive replies from your web servers.

*"This is just another example of customers asking for features, and us responding to that feedback - not in a matter of months or weeks, but in hours or days. mySites.guru is the ONLY service that iterates as fast and deploys to production many times a day*

*Join us today - [get your first month free!](#)"*

# Frequently Asked Questions

## **What does the 'Snapshot All' button do?**

It queues a snapshot job for every connected site at once, refreshing version numbers, PHP configuration, best practice checks, and available update data across all your sites in the background.

## **When is a good time to use 'Snapshot All'?**

It's particularly useful just before performing a mass update of Joomla or WordPress sites, so you have the latest status data for every site before making changes.

## **How quickly does mySites.guru respond to feature requests?**

mySites.guru deploys to production multiple times a day and typically responds to customer feature requests in hours or days, not weeks or months.
